

A conical glass is filled with water at a steady rate, prove that the function of the height of the surface of the water in the glass with respect to time has a cube root behavior.

From the similarity of the cyan and the yellow triangles we get

$$\frac{R}{h} = \frac{r(t)}{h(t)} \Rightarrow r(t) = c \cdot h(t)$$

the infinitesimal volume of water added is

$$\frac{dV}{dt} = \pi \cdot r(t)^2 \cdot \frac{dh}{dt} \Rightarrow c_1 = \pi \cdot r(t)^2 \cdot \frac{dh}{dt}$$

with substitution we get

$$\begin{aligned} c_1 &= \pi \cdot c^2 \cdot h(t)^2 \cdot \frac{dh}{dt} \\ h(t)^2 dh &= c_1 \frac{dt}{c^2 \pi} \\ \int h(t)^2 dh &= \frac{c_1}{c^2 \pi} \int 1 dt \\ \frac{h(t)^3}{3} &= \frac{c_1}{c^2 \pi} t + c_2 \\ h(t)^3 &= 3 \frac{c_1}{c^2 \pi} t + 3c_2 \\ h(t) &= \sqrt[3]{3 \frac{c_1}{c^2 \pi} t + 3c_2} \end{aligned}$$
